Education

The University of British Columbia — Vancouver, BC
Bachelor of Science – Computer Science — *Sept 2024 – May 2028*

Work Experience

Frontend Developer — June 2025 – Present
UBC MINT — *Vancouver, BC*

- Shipped 2 full-stack features, session persistence and pipeline export, for a research tool that lets neuroscience teams configure, save, and replay EEG signal processing pipelines, as the React engineer in a team with a Rust backend.
- Built session persistence via REST routes, a session modal, and GlobalContext state wired to the React Flow canvas.
- Built export/import via REST routes, dialogs, and client libs wiring pipeline state in and out of the signal graph.
- Cut regressions by 18% by adding 25+ Jest/RTL tests, boosting coverage to 84% across 10+ components & flows.

Marketing & Engagement Coordinator — June 2025 – April 2026
youCode 2026 – UBC Women in Computer Science — *Vancouver, BC*

- Expanded youCode'26 reach by 65% by running multi-channel campaigns and designing 30 story-driven visuals.
- Secured 20+ partners by coordinating outreach across 20+ campus clubs & 13 company sponsors.
- Raised engagement by 37% by analyzing 2024–2025 social media metrics & optimizing posting cadence.

Frontend Developer — May 2025 – June 2025
Nomadly — *Vancouver, BC*

- Boosted engagement by 55% by building a React 18/Three.js globe with custom textures & responsive UI.
- Improved location discovery by 18% by adding TopoJSON polygons, hover labels, and click-to-country routing.
- Enhanced realism by adding atmosphere shaders and emissive markers for 9 curated destinations.

Projects

Evo Parking Intelligence Layer | GitHub | *Product Design, Interaction Design, Systems Thinking, UX Research*

- Eliminated the navigation blackout car-share drivers face inside parking structures by designing an intelligence layer that surfaces lot hours, floor location, and access instructions across 50,000+ registered parkades before they reserve.
- Surfaced floor & lot status across 50,000+ parkades via a 4-tier trust system, from GPS estimate through Evo Ops review.
- Prevented closed-lot failures at reserve via a 30-minute proximity alert, waiving cancellation fees for switching cars.
- Shipped four parkade features against a zero-new-screens design constraint, each confined to its exact booking moment.

Procreate 3D | GitHub | *Swift, SwiftUI, RealityKit, iPadOS, Interaction design, 3D graphics*

- Eliminated the 3D modeling barrier for sketch-first designers by shipping an app that inflates any closed hand-drawn shape into a soft 3D asset in 10 to 30 seconds, ready to drop into a design or spatial workflow without touching a 3D tool.
- Cut mesh ridge artifacts to zero on all elongated shapes by capping dome height at a fraction of the interior maximum.
- Delivered USDZ and PNG export in 10 to 30 seconds fully on-device, with zero server calls via RealityKit's mesh engine.
- Reduced algorithm tuning from recompile to sub-second feedback by exposing 3 shape parameters as live in-app sliders.

Alice in Wellnessland | GitHub | *Next.js, TypeScript, React, MongoDB, Gemini API*

- Shipped an AI wellness app in 24 hours that eliminates the need to switch between three separate tools for voice journaling, mood analysis, and goal coaching, giving any person one coherent space for daily self-reflection.
- Guaranteed zero plaintext server storage via AES-GCM-256 encryption & PBKDF2 at 600,000 key-derivation iterations.
- Reached 5 to 10 second voice-to-text turnaround across all journal entries via the Gemini Live API's streaming pipeline.
- Sustained mood correlations for new users from entry one by building a fallback heuristic for sparse-data analysis.

Technical Skills

Methods & Research: User Experience (UX) Research, Interaction Design, Systems Thinking
Visual & Interaction Design: 3D Graphics, Spatial Computing, Figma, Canva
Technical: React, TypeScript, HTML/CSS, Three.js, Next.js, Google Gemini API
